INCINCO

Containerised Incinerators

Incinco manufacture and supply a range of containerised incinerators specifically designed for use in inaccessible locations, field hospitals, oil and gas exploration sites, and where a building is not available.

These units can be transported and installed to virtually any location anywhere in the world and contain all the auxiliary equipment (for transportation) within the one unit.

Manufactured to comply to local, EU or worldwide environmental standards this range provides the efficient solution to waste management for unusual or inaccessible sites combined with ease of shipping and transportation.

Why Incinco containerised Incinerators?

Incinco containerised incinerator units provide complete waste management solutions to remote sites throughout the world.

The smaller manually fed units are provided in 6m ISO containers and are easily transported and positioned on site. These portable systems are designed for camp sites and have been used extensively on pipeline and major construction projects in remote regions of the world. The incinerators range in size from 50kg/hr to 120kg/hr.

The larger incinerator systems provide auto feeding via ram loader and semi auto ashing via cast iron ash grate and ash trolleys. The incinerators range in size from 150kg/hr to 400kg/hr. These units are housed in 12m Hi Cube ISO containers – fully fitted with chequer plate flooring, fluorescent lighting, complete electrics and safety equipment. Weighing approximately 20 tonnes they provide the solution to many oil and gas camp site and hospital waste problems. On delivery to site and once positioned on a concrete base the unit can be set up - the refractory lined chimney is erected and the oil tank attached. Once the electricity supply is connected the system is commissioned, operator training provided and the unit is ready for operation.

Further auxiliary items can be added built in containerised units such as auto loading via bin tippler and full gas cleaning and monitoring systems. These larger 'complete package' systems can consist of up to 7 containers and provide the ultimate waste management solution for remote conditions. Because these units are compliant to full EU emissions regulations many customers use the carbon credits for investment purposes.
